

SRS Abstract Reviewer Instructions

The following information is a guide for reviewing abstracts for the Scoliosis Research Society's International Meeting on Advanced Spine Techniques (IMAST).

Timeline

Reviewers may review assigned abstracts at any time. Reviews must be completed by **Monday, October 1, 2025 at 11:59 pm US Eastern Time**. If you cannot complete your reviews by this date, please let us know as soon as possible so that an alternate reviewer can be assigned.

Abstract Scoring

Abstract selection is a multi-layered process that initially uses a scoring system outlined below, as well as judgement from the program chairs and category leads. The scoring system is one component of inclusion in the program, including authorship and a balanced, overall program. Occasionally, a highly scored abstract may not be selected for a podium presentation due to the needs of the overall program.

Assigned abstracts will be scored in three main categories: Quality, Methodology, and Innovation. Each category will be scored from a range of 1-5, with 1 being the best score.

- 1: Excellent
- 2-3: Good
- 4-5: Poor

A comment box is made available to you. Please use this to describe any necessary thought process to your scoring. If you receive an abstract in which you are an author, please select 'Yes' in the drop-down menu next to Conflict of Interest.

Scoring should favor abstracts/studies with:

- A topic that excites you - here innovation is celebrated.
- One-year follow-up is required for abstracts submitted to IMAST.
- Reports on new technologies or techniques are encouraged but should meet the criteria outlined above for well-designed studies and careful, unbiased analysis of resulting data.
- That adheres to the SRS Product-Specific Language Policy (below).

Product-Specific Language Policy

SRS strongly prefers that pharmaceuticals and proprietary software/databases as well as surgical approaches or specific instrumentation such as "Surgimap, MIMICS, EOS Imaging, ROTEM, Isola, TSRH, CD, XLIF, DLIF, AxiaLIF, Solera, Vertex, Expedium, Mountaineer, Shilla, VEPTR etc.," are not used in presentations. These terms should be replaced by a generic term or description of the drug, software/database and/or instrumentation or technique unless the use of the term directly impacts learners' understanding of the presentation or data. Instrumentation may also be referred to when the device name is a landmark system that is no longer sold (i.e. Harrington, Cotrel-Dubousset, Luque). Company names and logos must never be used in a presentation.
